Introduction

The AI Impact Evaluation for Managers defines how leaders across delivery, product, and project management roles integrate AI into their daily work and, critically, how they use AI to expand the scope and quality of their leadership.

This framework applies to Delivery Directors, Delivery Managers, Product Managers, Agile Facilitators, Project Managers, and Engineering Managers. It is designed as a single, universal model that works across all of these roles.

The manager who uses AI well does not just do their old job faster; they operate at a scope they could not reach before. AI should expand the manager's operating capacity, not just compress existing tasks.

2026 Timeline

Phase 1: AI Assessment		Phase 2: Performance Review & Calibration		Phase 3: Merit increases		Phase 4: Progress update	
April 14th - May 1st	Open GAP AI Impact Evaluation - Managers + Process Instructions	May 11th	GAPsters will have access to the Engagedly Performance Review, AI Assessment Report, and Leadership Assessment (if applicable).	May (retroactive to April 1st) For this cycle, merit increases will be reserved only for GAPsters who reach Level 3 (Transformer) on the AI Impact Framework.	Salary increases	From June to September	Monthly cycle of Progress Update to level up
		May 11th - May 15th	1:1 Sessions with PLs to discuss Performance Reviews, AI Assessment results, and merit increase eligibility.			July & October	Re-evaluation of Level 3
		May 18th - May 22nd	Salary Meetings: DMs will communicate the merit increase amount.				

Important: From March to October 2026, we will not be uploading goals in Engagedly, as our primary focus during this period is achieving Level 3 in AI.

AI Support Squad

Here are your go-to GAPsters that will support this process:

- **Assessment Queries:** Silvia Oconitrillo and Olman Quesada.
- **Raises & Performance Review:** Adriana Calderón and Laura Vargas
- **Client Support:** Steven Yelton, Milagro Prado and Kenneth Rivera
- **License Support:** Erika Carvajal and Paola Solano
- **AI Council (SMEs):** Sergio Morales, Phillipe Heymans, Daniel Ávalos, Rodrigo Rodríguez, Ana Chevez, Adriana Gómez

The 4-Level Scale

Each level reflects a distinct relationship between the manager and AI — from passive awareness to organizational transformation. Progression is measured by demonstrated impact, not just tool usage.

Level 0 — Aware but Passive

"I know it exists."

AI Usage: Minimal or experimental. No consistent application to management work. You are not yet incorporating AI into your management practice in any meaningful way. AI tools are either absent from your workflow or used so sporadically that they have zero impact on how you work or the outcomes you produce.

Impact: Insignificant; outputs and decisions are not informed by AI in any meaningful way.

Characteristics

- Has basic awareness that AI tools are available in the company, but does not apply them to management tasks
- May have tried ChatGPT or similar tools for personal curiosity, not for delivery, planning, or team leadership
- Does not use AI to prepare for meetings, draft communications, analyze data, or support decision-making
- Has not completed any AI-related training or onboarding

- Relies entirely on traditional methods for reporting, stakeholder management, planning, and team development
- Does not coach or encourage direct reports on AI adoption

Attitude Signal: Passive observer. May express uncertainty about AI's relevance to a management or leadership role. Skepticism or uncertainty about AI's relevance to delivery management. Perception that AI is "for developers" or "for content creation" but not for program/delivery management. Lack of time or motivation to experiment. Concern about data security or confidentiality prevents exploration.

Level 1 — Functional User

"I use it, but reactively."

AI Usage: Regular but opportunistic. Uses AI to complete isolated management tasks when prompted by an obvious need. You are not yet incorporating AI into your management practice in any meaningful way. AI tools are either absent from your workflow or used so sporadically that they have zero impact on how you work or the outcomes you produce.

Impact: Low-to-moderate; individual efficiency gains in personal management work, but no process-level or team-level change.

Characteristics

- Uses at least one approved AI tool (ChatGPT, Claude, Gemini, or role-specific tool) weekly for management tasks
- Applies AI to routine individual tasks: drafting status reports, summarizing meeting notes, preparing agendas, writing emails, researching topics
- Can write basic prompts, but results are inconsistent; relies on first-response output without structured iteration
- Reviews AI outputs informally (reads before sending), but lacks a structured validation approach
- Has completed foundational AI literacy training
- Does not yet connect AI usage to team performance improvement, delivery process optimization, or portfolio-level outcomes
- May encourage direct reports to explore AI, but does not actively coach, remove blockers, or track team AI adoption

Attitude Signal: Willing and experimenting. Uses AI as a personal convenience tool, not yet as a strategic lever for their team or portfolio. Frustration that AI doesn't understand the context of specific projects. Using AI as a writing assistant rather than an analytical or strategic tool. Not investing time in learning, multi-step workflows, or feeding AI project-specific data. Believing that AI usage equals AI impact.

Level 2 — Strategic Integrator

"I embed AI into how my area works."

AI Usage: Consistent and intentional. AI is part of the standard management workflow, not an occasional add-on. You have adopted an AI-first mindset for significant portions of your management work. You don't just use AI, you've redesigned how you work around it. You can point to specific, measurable improvements in speed, quality, accuracy, or team effectiveness. You are also enabling others.

Impact: Moderate-to-high; visible improvements in decision speed, deliverable quality, throughput, or communication efficiency within their area of responsibility.

Universal Behavioral Indicators

- Applies AI tools systematically across multiple recurring management workflows: planning, reporting, stakeholder communication, risk analysis, resource allocation, and team development
- Designs and iterates prompts with clear intent; uses techniques like chain-of-thought reasoning, role assignment, structured output formatting, or multi-step analysis
- Documents and shares effective AI workflows, prompts, or templates with peers and direct reports
- Applies critical judgment to AI outputs; identifies when AI analysis is insufficient, biased, or missing context, and corrects or discards results accordingly
- Follows validation best practices like: Source Check, Bias Scan, Contextual Fit, Stakeholder Lens, and the "Name on It" Test
- Can demonstrate measurable improvement in their area: faster decision cycles, higher deliverable throughput, reduced revision rounds, improved team onboarding time, or increased time allocated to high-leverage activities
- Actively coaches direct reports on AI integration, removes adoption blockers, and tracks team-level AI maturity progression
- Understands data privacy and responsible use policies and applies them consistently; does not input sensitive employee or client data into unapproved tools

Attitude Signal: Proactive enabler. Advocates for AI adoption in their immediate environment and lead by example. Views AI as a thinking partner and analytical tool, not just a text generator. Invests time in crafting detailed, context-rich prompts and iterating on outputs. Feeds AI project-specific data rather than relying on generic outputs. Actively measures the before/after impact of AI integration. Shares learnings and tools with team and peers

Level 3 — AI Value Leader

"I transform how my team (project, account, organization) operates through AI."

AI Usage: Advanced and systemic. Designs, automates, or orchestrates AI-powered management workflows beyond individual tasks. Operates at a scope that was not possible before AI. You are not just using AI, you are building with it. You create AI agents, automated pipelines, and custom solutions that transform how delivery management is practiced, not just for yourself but for your team and potentially across the organization. You are a force multiplier.

Impact: High; drives measurable process transformation, automation, or innovation with cross-team, portfolio-level, or organizational reach.

Characteristics

- Designs or leads AI-powered management workflows that automate multi-step processes (e.g., automated status aggregation, AI-driven account health monitoring, risk detection pipelines, onboarding flows)
- Proactively identifies high-value automation or AI integration opportunities in their area and builds a case for implementation, either by building solutions directly or by architecting and championing them
- Produces reusable AI assets (prompt libraries, workflow templates, automation blueprints, management playbooks) adopted by other managers or teams
- Systematically develops direct reports' AI maturity; demonstrably moves team members from lower levels to higher ones through coaching, enablement, and removing blockers
- Demonstrates at least one documented case of significant process improvement or automation with measurable business impact (decision cycle time, cost, quality, capacity, or commercial outcomes)
- Uses AI to expand operating scope: reclaims time from administrative work and reinvests it in high-leverage activities such as strategic planning, client relationships, team development, or new initiatives
- Engages critically with AI governance: flags risks, proposes guardrails and contributes to responsible use practices across the organization
- Combines two or more AI tools into integrated workflows (e.g., Claude + N8N/Zapier, Gemini + project management tools, AI analysis + automated reporting)
- Contributes to organizational AI strategy beyond their own portfolio; participates in AI adoption initiatives, mentors other managers, creates L&D content, or shapes company-wide AI practices

Attitude Signal: Organizational multiplier. Sees AI as a capability-building responsibility, not just personal efficiency. Transforms how their teams and the broader organization operate. Thinks in terms of systems and automation, not just individual task assistance. Comfortable combining AI

with other tools, APIs, workflow automation, and data platforms. Proactively identifies opportunities to replace manual processes with AI-powered ones. Shares and scales solutions rather than keeping them personal. Serves as a mentor, evangelist, or strategist for AI adoption.

Five Evaluation Dimensions For Managers

The evaluation assesses five areas, each redefined through a management lens. Within each area, we describe what “good” looks like at each maturity level.

1. AI Integration in Your Daily Management Workflow

Objective: Transition from a "Manual-First" to an "AI-First" management workflow.

This area measures how habitually you use AI tools for planning, reporting, stakeholder communication, risk analysis, resource allocation, and team development. The goal is to offload administrative and repetitive management work so you can focus on high-leverage leadership activities.

What Good Looks Like at Each Level

- **Level 0:** Does not use AI for management tasks. All planning, reporting, and communication is done manually.
- **Level 1:** Uses AI occasionally for drafting emails, summarizing documents, or preparing meeting agendas. Usage is reactive and task-specific.
- **Level 2:** AI is embedded in daily routines. Uses it consistently for meeting preparation, status reporting, decision analysis, team planning, and stakeholder communication. Maintains persistent context across sessions.
- **Level 3:** AI is the default starting point for all management workflows. Has designed repeatable AI-powered processes for recurring work. Time reclaimed from admin tasks is reinvested in strategy, relationships, and team development.

2. Appropriate Use of AI and Validation of Outputs

Objective: Maintain a "Human-in-the-Loop" architecture for safety, accuracy, and judgment.

Managers are accountable for every output they deliver, regardless of whether AI helped produce it. This area evaluates critical supervision of AI outputs, data governance practices, and

the ability to apply validation best practices, such as: Source Check, Bias Scan, Contextual Fit, Stakeholder Lens, and the "Name on It" Test (Are you comfortable putting your name on this as-is? If not, what needs to change?)

What Good Looks Like at Each Level

- Level 0: Does not use AI, so validation is not applicable. However, also does not understand the risks and governance requirements of AI usage.
- Level 1: Reviews AI outputs informally before using them. Reads before sending but does not apply structured validation criteria. May not fully understand data privacy implications.
- Level 2: Applies the validation best practices consistently. Checks AI outputs against source data, scans for bias, evaluates contextual fit, considers stakeholder perspectives, and only publishes what they would put their name on. Follows data governance policies for sensitive information.
- Level 3: Models exemplary validation behavior for the organization. Contributes to defining responsible use practices and guardrails. Coaches others on validation techniques. Understands where AI should not replace human judgment (especially people's decisions) and actively enforces those boundaries.

Use AI to prepare your thinking, never to replace it. If you cannot defend the output without mentioning AI, it is not ready.

3. Productivity and Measurable Impact on Delivery Outcomes

Objective: Translate AI usage into tangible value for the team, portfolio, and organization.

This area measures your ability to demonstrate that AI is producing real results, not just perceived efficiency. The proof is in measurable outcomes, for example:

Manager Impact Metric Categories

Metric Category	What It Measures
Decision Cycle Time	Time from the problem surfaced to the decision made. Days to produce a strategic recommendation. Meeting-to-resolution ratio.
Output Volume & Quality	Deliverables shipped per quarter. Revision rounds before approval. Time spent on a deliverable vs. prior baseline.
Team Throughput & Capacity	Direct reports' output per capita. Time-to-onboard new hires. Ratio of 1:1 time on growth vs. firefighting.

Communication Efficiency	Email/Slack volume sent vs. outcomes-driven. Time spent on recurring comms. Stakeholder satisfaction with clarity.
Strategic Leverage of Time	Hours reclaimed per week from admin/routine work. Calendar ratio of high-leverage vs. low-leverage activities. New initiatives launched with freed capacity.
Knowledge Management	Standard Operating Procedures/playbooks created or updated. Time for the team to find answers without escalating. Reduction in repeated questions.

What Good Looks Like at Each Level

- **Level 0:** No measurable AI-driven impact. All outputs reflect the pre-AI baseline.
- **Level 1:** Can point to personal time savings on individual tasks, but cannot demonstrate impact on team or delivery outcomes.
- **Level 2:** Demonstrates measurable improvement in at least one metric category. Can provide before/after evidence. Impact is visible to the team and stakeholders.
- **Level 3:** Demonstrates measurable improvement across multiple metric categories. Uses freed capacity to launch new initiatives, deepen client relationships, or drive strategic outcomes that would not have existed without AI-enabled efficiency.

4. Capacity to Design and Orchestrate AI-Driven Processes

Objective: Evolve from a "Tool User" to a "System Orchestrator."

This area evaluates your ability to move beyond using AI for isolated tasks and instead design, build, or champion AI-powered workflows and systems that transform how work is done. Managers can qualify by building solutions themselves or by architecting and championing them for others to implement.

What Good Looks Like at Each Level

- **Level 0:** No engagement with AI-driven process design or automation.
- **Level 1:** Understands that AI can automate workflows but has not designed or implemented any. May request others to explore automation.
- **Level 2:** Has designed or implemented at least one AI-enhanced management process (e.g., AI-assisted reporting, automated agenda generation, AI-driven risk flagging). Actively explores how AI tools can be combined.
- **Level 3:** Designs and leads multi-step AI-powered workflows using tools like but not limited to N8N, Zapier, Claude Code or custom integrations. Builds or architects

automated pipelines for recurring management processes. Combines two or more AI tools into integrated systems. Creates reusable blueprints adopted by other managers or teams.

5. Use of AI as a Multiplier Across Teams and the Organization

Objective: Act as a "Multiplier" for the organization, its teams, or clients.

This area measures how you extend AI value beyond your own work. For managers, the multiplier effect is especially powerful because your leverage is through people; every team member you uplevel multiplies the impact across the entire portfolio.

What Good Looks Like at Each Level

- **Level 0:** Does not contribute to AI adoption beyond personal use (if any). No mentoring, no shared resources, no organizational participation.
- **Level 1:** Encourages team members to explore AI tools. May share interesting prompts or articles. Does not actively track team AI adoption or remove blockers.
- **Level 2:** Actively coaches direct reports on AI integration. Participates in internal AI initiatives. Shares effective workflows and templates with peers. Begins to connect AI usage to client value.
- **Level 3:** Demonstrates deep multiplier impact through one or more of the following: systematically uplevels direct reports' AI maturity; creates AI-enhanced management frameworks adopted by other managers; uses AI to unlock new commercial value (expansion signals, account health, AI-native delivery conversations); influences organizational AI strategy beyond their own portfolio; contributes to L&D content or mentors managers at lower levels.

Evaluation System

Step 1: Self-Evaluation and Evidence Collection

Goal: Each GAPster will complete this [GAP AI Impact Evaluation - Managers](#) to explain how AI is integrated into their daily work and what real impact it is producing. The focus should be on improvements, results, and ways of working that have been demonstrated in the **past 6 months** and are now part of your normal workflow.

Please support your answers with **real examples**, not hypothetical scenarios. The information submitted in this form will be reviewed and validated as part of the evaluation process, so responses should be based on realistic evidence and should avoid exaggerated, misleading, or unverifiable claims.

Important: To comply with our security policy, we cannot accept full client source code. Please share only a limited snippet or an image of the relevant section. Make sure to remove any sensitive information or credentials before sending, as we are not permitted to access the full repository.

In the form, you will be asked to provide information and evidence across **five areas**:

1. AI Integration in Your Daily Management Workflow

2. Appropriate Use of AI and Validation of Outputs
3. Productivity and Measurable Impact on Delivery Outcomes
4. Capacity to Design and Orchestrate AI-Driven Processes
5. Use of AI as a Multiplier Across Teams and the Organization

Step 2: Multi-Agent AI Evaluation

Goal: The information collected in Step 1 will be analyzed by a **multi-agent AI evaluation system** that assesses the five evaluation categories.

More than 20 dimensions are evaluated across these categories. Each dimension is reviewed through a system of **three AI agents** working together to improve the reliability of the evaluation:

1. **Evaluator Agent:** Analyzes the submitted evidence and produces an initial score.
2. **Adversarial Agent:** Challenges the reasoning, looking for weak claims, inconsistencies, or unsupported conclusions.
3. **Referee Agent:** Reviews both perspectives and determines the final score for that dimension.

All dimension scores are then **aggregated into a composite result**, which produces an initial **AI Maturity classification**.

Step 3: Report Generation

Goal: After the submission period closes, a classification agent determines the appropriate **AI maturity classification** based on the evaluation scores and generates a report for each manager summarizing the results for their team members.

The report includes the proposed maturity classification, the overall AI maturity score, a summary of the evaluation reasoning, and the key information and evidence submitted in the self-evaluation.

Step 4: Human-in-the-Loop Validation (Manager Review)

Goal: Each report will be reviewed by the manager in collaboration with the corresponding project lead to validate whether the proposed evaluation accurately reflects the employee's real impact of AI usage in project work.

Managers can take one of two actions: **confirm the proposed level** or **challenge it** if they believe it does not reflect reality. They can propose an adjustment if they believe the level should be higher or lower based on their observations. When proposing a change, the manager must provide a short explanation grounded in project outcomes, delivery performance, and actual AI usage patterns.

Step 5: Dispute and Final Calibration Review

Goal: To ensure fairness and consistency across the organization, all challenged evaluations will be reviewed and approved by the corresponding Director.

This step determines the **final AI maturity classification** for each employee. Once the review is completed, managers and personal leads will receive the finalized results, and the outcomes will be shared with the relevant departments for any next steps.

All steps of the process will be **recorded for transparency and future reference**. The results can be used to track progress across evaluation cycles, identify development opportunities, and guide future initiatives related to **AI adoption and effectiveness**. These records may also inform future evaluation cycles.

Resource Directory

GAP provides a comprehensive suite of tools and training to help you start or accelerate your journey toward becoming a Level 3 Transformer. Make sure to review the [Official and blacklisted applications list](#) first.
